

1 Overview

T5UIC1 is a simplified version of the serial command screen designed for applications that do not require a touch screen, simple UI functions, and demanding cost requirements based on Diwen Technology T5 CPU.

Its main features include:

(1) 65K color TFT display.

(2) Basic drawing commands, Chinese and ASCII text display, support JPEG icon, JPEG picture, bar code, two-dimensional code display. (3) 384Kbytes font space.

Stored 6*12-32*64 dot matrix ASCII and 12*12-64*64 dot matrix GB2312 Chinese character library (Chinese characters are scaled based on 16*16 dot matrix) .

(4) 512Kbytes image and icon storage space is divided into 16 storage spaces according to 32KB.

It can store up to 16 JPEG full-screen pictures.

Or store 0-16 JPEG icon library files (a single icon library file can exceed 32KB and occupy multiple memory spaces). (5) 32Kbytes SRAM data memory that can be read and written by serial port, the data is lost when power is off, and it is initialized to 0x00 when power on.

Mainly used in online pictures, icon library data update, or real-time JPEG icon, picture display. (6) 16Kbytes Flash data memory that can be read and written by serial port, the data will not be lost when power off, and the write life is 100,000 times.

Mainly used for data storage such as user configuration parameters.

(7) SD/SDHC interface configuration parameters and update fonts and pictures.

(8) An additional full-duplex serial port is extended.

(9) The CPU can be configured to run at 250MHz or 400MHz.

2 Serial port instruction set

2.1 Basic conventions

(1) Color definition

16bit colour, 5R6G5B mode

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
R4	R3	R2	R1	R0	G5	G4	G3	G2	G1	G0	B4	B3	B2	B1	B0

(2) Coordinate system

2.2 Serial data frame format

The serial port is fixed in 8N1 mode, and the baud rate is configured with SD card by T5UIC1.CFG file.

Serial data frame consists of frame header, instruction, data, CRC check, and end of frame. It consists of 4 parts, which are described in the following table:

Frame header	instruction	data	CRC check (optional)	End of frame
Fixed at 0xAA	1 byte, see instruction set description.	The maximum length is 248 bytes.	CRC check of instructions and data	Fixed as 0xCC 33 C3 3C

2.3 Instruction set

(1) Configuration and interface commands

Features	Instruction	data	Description
shake hands	0x00	None (issued)/0x4F4B (screen response)	For example: Tx: AA 00 CC 33 C3 3C Rx: AA 00 4F 4B CC 33 C3 3C
CRC report	0xFF	0x01	When the serial port CRC check is enabled, if the CRC check fails, it will automatically respond to this
Backlight brightness adjustment	0x30	DIM_Set	command. DIM_Set: backlight brightness value, 0x00-0xFF. 0x00 backlight is off, 0xFF backlight is the brightest, among which 0x01-0x1F setting value backlight It may flicker. The power-on default value is 0xFF. Example: AA 30 80 CC 33 C3 3C Adjust the brightness to 50%.
Write data memory	0x31	Issued: Type, Address, Datas Write Flash response: 0xA5 0x4F 0x4B.	Processing time, SRAM can be ignored; Flash takes up to 1 second. Type: Write memory selection, 0x5A=32KB SRAM, 0xA5=16KB Flash. Address: write data memory address, 0x0000-0x7FFF or 0x3FFF. Datas: The data string to be written. Example: AA 31 5A 00 00 31 32 33 34 CC 33 C3 3C write SRAM
Read data memory	0x32	Issued: Type, Address, Length Response: Type, Address, Length, Datas	Processing time, SRAM can be ignored, Flash delay is about 0.1ms. Type: Read memory selection, 0x5A=32KB SRAM, 0xA5=16KB Flash. Address: write data memory address, 0x0000-0x7FFF or 0x3FFF. Length: The length of the read data byte, 0x01-0xF0. Datas: the read data string. For example: Tx: AA 32 5A 00 00 04 CC 33 C3 3C Read SRAM Rx: AA 32 5A 00 00 04 31 32 33 34 CC 33 C3 3C data response
Write picture memory	0x33	Issued: 0x5A, 0xA5, PIC_ID Response: 0xA5 0x4F 0x4B.	The processing time can take up to 2 seconds. Write the contents of the 32KB SRAM data memory into the designated image memory space. PIC_ID: Picture memory space location, 0x00-0x0F, each space is 32Kbytes. For example: Tx: AA 33 5A A5 00 CC 33 C3 3C Rx: AA 33 4F 4B CC 33 C3 3C
Display direction adjustment	0x34	Issued: 0x5A, 0xA5, Dis_CFG Response: 0xA5 0x4F 0x4B	Dis_CFG is defined as follows: 0x00=0 degrees, no rotation. 0x01=90 degree rotation. 0x02=180 degrees, the viewing angle is flipped. 0x03=270 degree rotation. For example: Tx: AA 34 5A A5 02 CC 33 C3 3C Rx: AA 34 4F 4B CC 33 C3 3C
Expansion serial port Configuration	0x38	Bode_Set	Bode_Set: Set the baud rate of the extended serial port, 0x0001-0x03FF. Bode_Set=15667200/baud rate, the lowest baud rate is 15300. The power-on default value is 0x0088, which corresponds to a baud rate of 115200bps. For example: AA 38 03 80 CC 33 C3 3C Set the baud rate of the extended serial port to 19200bps.
Expansion serial port Data sending	0x39	Datas	Send the Datas packet from the extended serial port. For example: AA 39 31 32 33 34 35 36 37 38 39 CC 33 C3 3C Send the character string "123456789" from the extended serial port.
Expansion serial port Data reception	0x3A	Len_Data, Datas	The screen actively uploads the data received by the extended serial port. Len_Data: The length of the data uploaded this time. Datas: The data uploaded this time. For example: Assuming that the extended serial port receives a byte of data 0x55, the screen will automatically upload AA 3A 01 55 CC 33 C3 3C.

(2) Drawing related instructions

Instruction	data	Description
0x01	Color	<p>Clear the screen; processing time 1.5mS (corresponding to 400MHz main frequency, the same below).</p> <p>Color: Clear screen color.</p> <p>Example: AA 01 00 1F CC 33 C3 3C</p>
0x02	Color,Nx,Ny,(X0,Y0).....(Xn,Yn)	<p>Set point; processing time=0.4*Nx*Ny*number of set points uS.</p> <p>Color: Set point color.</p> <p>Nx: Actual pixel size in X direction, 0x01-0x0F.</p> <p>Ny: actual pixel size in Y direction, 0x01-0x0F. (Xn, Yn):</p> <p>Set point coordinate sequence.</p> <p>Example: AA 02 F8 00 04 04 00 08 00 08 01 00 01 00 CC 33 C3 3C</p>
0x03	Color,(X0,Y0),.....(Xn,Yn)	<p>End point connection; processing time=0.5*Max (length of line segment in X direction, length of line segment in Y direction) uS.</p> <p>Color: Connection color, 2Bytes.</p> <p>(Xn, Yn): End point coordinates of the line segment.</p> <p>Example: AA 03 FF FF 00 40 00 40 01 00 01 00 CC 33 C3 3C</p>
0x05	Mode,Color,(Xs,Ys),(Xe,Ye)	<p>Rectangular area display; processing time=0.14*number of pixels uS.</p> <p>Mode:</p> <p>0x00=Color color displays a rectangular frame.</p> <p>0x01=Color fills the rectangular area with color.</p> <p>0x02=Color XOR rectangle area data, mostly used for menu selection/unselection coloring.</p> <p>Color: color.</p> <p>(Xs,Ys),(Xe,Ye): The coordinates of the upper left and lower right corners of the rectangle.</p> <p>Example: AA 05 02 07 E0 00 40 00 40 01 00 01 00 CC 33 C3 3C</p>
0x08	(x,y), Wide, Color1, Color0, data	<p>Two-color bitmap filling; processing time=0.22*number of filled pixels uS.</p> <p>(X, y): the starting point coordinates of the upper left corner of the bitmap filled area;</p> <p>Wide: the width of the filled area in the X direction, 0x0001-0x01E0;</p> <p>Color1: the fill color corresponding to bit1;</p> <p>Color0: fill color corresponding to bit0;</p> <p>data: Fill in the data. Note that the data needs to be left-aligned to 1Byte in the width direction.</p> <p>For example, to fill the width of 6 pixels, it also needs to occupy 1Byte space, and the higher 6bit is effective.</p> <p>For example:</p> <p>AA 08 0004 0004 00 08 0000 FFFF 7C C6 C6 C6 7C C6 C6 C6 7C CC 33 C3 3C</p>
0x09	Mode, DIS, Color, (Xs,Ys), (Xe, Ye)	<p>The screen area moves; processing time=0.20*the number of pixels in the moving area uS.</p> <p>Mode: mobile mode</p> <ul style="list-style-type: none"> 7: Movement mode, 0=circular movement. 1=Translation, the vacant area is filled with color. 6-4: Write 0.. 3-0: Moving direction, 0x00=left. 0x01=to the right. 0x02=Up. 0x03=Down. <p>DIS: moving distance, number of pixel dots, 0x0000-horizontal resolution/2, 2Bytes. Color: Fill color, only valid when DIR.7=1.</p> <p>(Xs, Ys): The coordinates of the upper left corner of the selected area.</p> <p>(Xe, Ye): The coordinates of the lower right corner of the selected area.</p> <p>Example: AA 09 00 00 08 FF FF 00 40 00 40 01 00 01 00 CC 33 C3 3C</p>

(3) Text related instructions

Instruction	data	Description
0x11	Mode, Color, Bcolor, (X, y), Strings	<p>Character string display; the processing time of a 16*16 dot matrix Chinese character is 76μs, and the rest are converted according to the ratio of the dot matrix number.</p> <p>Mode: Display mode.</p> <ul style="list-style-type: none"> . 7 Character width adjustment setting 1=adjust 0=no adjustment. . 6 Background color display setting 1=display 0=not display. . 5-.4 Write 0.. . 3-.0: Font size, 0x00-0x09, the corresponding font size is as follows: 0x00=6*12 0x01=8*16 0x02=10*20 0x03=12*24 0x04=14*28 0x05=16*32 0x06= 20*40 0x07=24*48 0x08=28*56 0x09=32*64 <p>Color: Character display color.</p> <p>Bcolor: The color of the character background display.</p> <p>(X, y): The coordinates of the upper left corner of the string display.</p> <p>Strings: Strings to be displayed, non-ASCII characters are displayed according to Chinese characters in GB2312 encoding format.</p> <p>For example: AA 11 41 FF FF 00 00 00 20 00 80 44 57 49 4E 20 B5 CF CE C4 CC 33 C3 3C</p>
0x14	Mode, Color, Bcolor, Num_I, Num_F, (X, y), Datas	<p>Data variable display; processing time is the same as 0x11 instruction calculation.</p> <p>Mode: Display mode.</p> <ul style="list-style-type: none"> . 7 Background color display setting 1=display 0=not display. . 6 1=signed number 0=unsigned number. . 5 1=Invalid 0 Display 0=Invalid 0 No display. . 4 1=Invalid 0 is displayed as 0. 0=Invalid 0 is displayed as a space. . 3-.0: font size, 0x00-0x09, same as 0x11 command; 0x0A-0x0F Use font 0x02:7400-0x02:BBFF to use the special dot matrix size characters of the 18KB font space, arranged in the order of 0-9, ., -, +, SP (space). 0x0A=64*120 dot matrix; 0x0B=44*80 dot matrix. <p>Color: Character display color.</p> <p>Bcolor: The color of the character background display.</p> <p>Num_I: The number of integer digits displayed, 0x01-0x14. Num_F: The number of decimal places displayed, 0x00-0x14, the sum of Num_I+Num_F cannot exceed 20. (X, y): The coordinates of the upper left corner of the variable display.</p> <p>Datas: Data variables, up to 8 bytes.</p> <p>Example: AA 14 85 FF FF 00 00 0A 02 00 00 00 00 49 96 02 D2 CC 33 C3 3C</p>

(4) Instructions related to pictures and icons

Instruction	data	Description
0x21	(X,Y) , QR_Pixel, DATA	<p>QR code display; QR_Pixel=4 QR code processing time is 7.5mS.</p> <p>(X, y): the coordinate position displayed by the QR code;</p> <p>QR_Pixel: The size of pixels occupied by each point of the QR code,</p> <p>0x01-0x0F; DATA: Display data, up to 154 bytes.</p> <p>The size of the QR code is (46*QR_Pixel)*(46*QR_Pixe) dot matrix.</p> <p>Example: AA 21 00 08 00 08 04 68 74 74 70 3A 2F 2F 77 77 2E 64 77 69 6E 2E 63 6F 6D 2E 63 6E CC 33 C3 3C</p>
0x22	0x00, JPEG_ID	<p>JPEG picture display; 480*272 resolution 4:1:1 format compression processing time is 250mS.</p> <p>Display JPEG pictures saved in 512Kbytes picture memory. The picture is also cached in the 0# virtual display area (0x27 command operation can be used)</p> <p>JPEG_ID: 0x00-0x0F, corresponding to the starting ID of the picture stored in JPEG.</p> <p>Example: AA 22 00 00 CC 33 C3 3C</p>
0x23	(X,y) , Mode, Icon_IDs	<p>Icon library icon display; 1 28*45 icon, background display mode, processing time 3.2mS.</p> <p>(X, y): the starting position of the first icon, corresponding to the upper left corner of the icon.</p> <p>Mode: Icon display mode.</p> <ul style="list-style-type: none"> .7 Icon background display settings: 0=Background filtering is not displayed, 1=Background display. When setting the background filter to not display, the background must be pure black. .6 Restore the background image settings (only when .7=0 Valid when): 0=Background pictures are not restored, 1=Automatically use 0# virtual display area pictures for background restoration. .5 Background filtering strength selection (only valid when .7=0) 0=normal, 1=enhanced .4 Undefined, write 0. .3-0 Icon library storage location, 0x00-0x0F. <p>Icon_IDs: Icon IDs that need to be displayed, each ID is represented by 1 Byte, 0x00-0xFF.</p> <p>Example: AA 23 00 10 00 10 08 00 01 02 03 CC 33 C3 3C</p>
0x24	(X,y) , Mode, Address	<p>SRAM memory icon display; 1 28*45 icon, background display mode, processing time 3.1mS.</p> <p>(X, y): The display position of the icon, corresponding to the upper left corner of the icon.</p> <p>Mode: Icon display mode.</p> <ul style="list-style-type: none"> .7 Icon background display settings: 0=Background filtering is not displayed, 1=Background display. When setting the background filter to not display, the background must be pure black. .6 Undefined, write 0. .5 Background filtering strength selection (only valid when .7=0) 0=normal, 1=enhanced .4-0 Undefined, write 0. <p>Address: The starting address of SRAM memory to store JPEG icon data, 0x0000-0x7FFF.</p> <p>Example: AA 24 00 10 00 10 00 00 00 CC 33 C3 3C</p>
0x25	0x01, JPEG_ID	<p>The JPEG picture is decompressed to 1# virtual display area.</p> <p>480*272 resolution 4:1:1 format compression processing time is 240mS.</p> <p>Decompress the JPEG pictures saved in the 512Kbytes picture memory to the 1# virtual display area, which is convenient Copy, paste and other operations of the icon.</p> <p>JPEG_ID: 0x00-0x0F, corresponding to the starting ID of the picture stored in JPEG.</p> <p>Example: AA 25 01 01 CC 33 C3 3C</p>
0x26	(Xs,Ys) , (Xe, Ye) , (X,y)	<p>1# Copy and paste the designated area of the virtual display area to the current display interface.</p> <p>256*256 dot matrix pixel area processing time is 12.5mS (0.2uS per pixel)</p> <p>(Xs, Ys): 1# The coordinates of the upper left corner of the selected area of the virtual display area icon. (Xe, Ye): 1# The coordinates of the lower right corner of the area specified by the icon in the virtual display area. (X, y): When pasting to the current display area, the coordinate position of the upper left corner.</p> <p>Example: AA 26 00 40 00 40 01 00 01 00 00 20 00 20 CC 33 C3 3C</p>
0x27	Mode,(Xs,Ys) , (Xe, Ye) , (X,y)	<p>Copy and paste from the designated area of the virtual display area to the current display interface.</p> <p>256*256 dot matrix pixel area processing time is 12.5mS (0.2uS per pixel)</p> <p>Mode: Display mode.</p> <ul style="list-style-type: none"> .7 Background display setting 0=Background filtering is not displayed, 1=Background display. When setting the background filter to not display, the background must be pure black. .6 Restore the background image settings (only when .7=0, .1=1 Valid when): 0=Background pictures are not restored, 1=Automatically use 0# virtual display area pictures for background restoration. .5 Background filtering strength selection (only valid when .7=0) 0=normal, 1=enhanced .4-1 Reserved, write 0. .0 The virtual display area selects 0=0#virtual display area, 1=1#virtual display area. <p>(Xs, Ys): The coordinates of the upper left corner of the selected area of the icon in the virtual display area. (Xe, Ye): The coordinates of the lower right corner of the icon area in the virtual display area. (X, y): When pasting to the current display area, the coordinate position of the upper left corner.</p> <p>Example: AA 27 01 00 40 00 40 01 00 01 00 00 40 00 40 CC 33 C3 3C</p>
0x28	(X,y), Mode, Icon_Lib, Icon_IDs, Icon_IDe, Delay_Time	<p>The icon animation automatically displays the command settings.</p> <p>(X, y): The starting position of the animation icon, corresponding to the upper left corner of the icon.</p>

		<p>Mode: Animation icon display mode.</p> <p>.7 Switch control 1=This group of animation is on 0=This group of animation is off; it can be controlled by 0x29 command.</p> <p>.6 Start mode 1=start from the start icon 0=start from the last stop position.</p> <p>.5-4 Undefined, write 0.</p> <p>.3-0 This group of animation icon command positions, 0x00-0x0F, has a total of 16 groups of animation commands.</p> <p>Icon_lib: icon library storage location, 0x00-0x0F. Icon_IDs: the starting icon position of the animation, 0x00-0xFF. Icon_IDe: the position of the animation termination icon, 0x00-0xFF. Delay_time: The display time interval of the animation icon, 0x00-0xFF, the unit is 10mS.</p> <p>Example: AA 28 00 10 00 10 80 09 00 09 0A CC 33 C3 3C Set the 0th group animation</p>
0x29	Cartoon_Set	<p>Icon animation automatically displays command control.</p> <p>Cartoon_Set: ICON animation command switch control;</p> <p>Each bit corresponds to a set of instructions, 1=on, 0=off;</p> <p>.15 Corresponding to the 15th group of animation commands, 0 Corresponds to the 0th group of animation commands.</p> <p>Example: AA 29 00 05 CC 33 C3 3C Turn on group 0 and group 2 animation commands.</p>
0x2A	(X,Y) , DATA	<p>EAN-13 bar code display, the processing time is about 0.5mS.</p> <p>(X, y): The coordinate position displayed by the barcode must be an even number.</p> <p>DATA: 12Bytes barcode data, the data is HEX encoding mode (0x00-0x09). The width of the barcode bit module is fixed to 2 pixels, and the size of the entire barcode area is 222*94 dot matrix.</p> <p>For example:</p> <p>AA 2A 00 08 00 08 09 07 08 07 05 03 09 09 08 03 02 04 CC 33 C3 3C</p>

3 SD/SDHC interface

The downloaded file must be placed in the root directory of the SD card **DWIN.SET** Folder and must be 4KB sector, FAT32 format SD or SDHC card.

The file naming instructions are as follows:

file type	Naming rules	Description
Program upgrade file	T5UIC1_*.BIN	
Hardware profile	T5UIC1.CFG	
Font file	0T5UIC1.HZK	T5UIC1 font library special extraction software generation.
JPEG file	Image storage ID + (optional) file name.JPG (For example, 0 boot interface.JPG)	The image or icon library stores ID 0-15. The JPEG file must be the same as the physical resolution of the screen, Baseline mode, 4:4:4 or 4:1:1 format.
JPEG icon file	ICON storage ID + (optional) file name.ICO (For example, 8 icon library.ICO)	The file size of a single JPEG image cannot exceed 32Kbytes.

T5UIC1.CFG hardware configuration file adopts binary data format, and write 0x00 to save unused data, which can be edited by software such as UltraEdit.

Edit, the description is as follows:

category	address	length	definition	Description
Configuration recognition	0x00	4	0x54 0x35 0x43 0x31	Fixed content.
System Configuration	0x04	1	System Configuration	<ul style="list-style-type: none"> .7 CPU frequency selection 0=250MHz 1=400MHz .6 Power-on display settings 0=display the 0th# picture 1=black clear screen, backlight off .5 Serial port CRC check switch 0=off 1=on .4-2 Undefined, write 0 .1-0 Display direction setting 0x00 (00) = 0 degrees, no rotation. 0x01(01)=90 degree rotation. 0x02(10)=180 degrees, the viewing angle is reversed. 0x03(11)=270 degree rotation.
Screen selection	0x05	1	Display selection	0x00=480*272 DMT48270C043_04WN 0x01=240*320 DMT32240C028_04WN (old model LCD screen) 0x02=320*240 DMT32240C035_04WN 0x03=240*320 DMT32240C028_04WN 0x04=320*480 DMT48320C035_04WN 0x05=240*320 DMT32240C024_04WN(EWTN screen) 0x06=320*480 DMT48320C035_04WN*(IPS screen) 0x07=240*320 screen DMT32240C08=240*320WN 0x32(240*020) *(IPS screen) Write 0x5AA5 to start
System clock calibration	0x06	2	System clock calibration	system clock calibration. During the calibration process, the UART2 serial port sends more than 30 data packets of 0x55 data at 115200bps, 8N1 mode, and 30mS intervals. It has been calibrated before leaving the factory, so no additional calibration is required during use.
Baud rate setting	0x08	2	Serial port baud rate setting	Setting value =7833600/Set the baud rate. Setting value range = 1-1023, the lowest baud rate is 7757bps. 0x0044=115200bps.
Screen selection enable	0x0A	1	Screen selection enable	0x5A=0x05 The screen selection configuration of the address is valid. Other=The configuration is invalid.

During the download process, the screen displays blue, and the screen resets or displays red after the download is complete.

Appendix 1 Revision History

date	modify the content	version
2017.04.17	Initial Release.	V1.0
2017.09.25	Unified into the T5UIC1 platform.	V1.0
2018.02.23	Flash expands 512Kbytes, adds 16*16 dot matrix GB2312 Chinese character library, expands the number of pictures to 16; adds 0x21 two-dimensional code display instructions.	V1.1
2018.03.14	Added support for 480*320 display screen.	V1.2
2018.04.13	Use 16*16 dot matrix Chinese characters as the benchmark to zoom in and out to expand the display range of Chinese characters to	V1.3
2018.11.21	12*12-64*64. Added 250MHz/400MHz main frequency selection; Added the option to display 0# picture or black screen at boot; Added 400MHz main frequency, instruction processing time reference, 250MHz time*1.6 times calculation; Added 0x23 icon library ICON display instruction; Added 0x24 SRAM memory ICON display command for real-time JPEG picture display; Added 0x27 0# virtual display area copy and paste commands; Added 0x28, 0x29 animation icon commands; Added 0x31, 0x32 read and write data memory (16KB Flash or 32KB SRAM) instructions; Added 0x33 to write the 32KB SRAM data memory content into the picture memory command for online picture update; Added 0x34 display direction adjustment command.	V2.0
2019.12.02	The serial port adds CRC check option.	V2.1
2020.04.07	Added 0x08 two-color bitmap filling command. Added 0x2A EAN-13 barcode display.	V2.2
2021.03.03	CFG file 0x0A address has been added with the screen selection enable setting.	V2.3
